Cover Letter
26-November-2019

Dear Sir or Madam,

I am interested in Credit Suisse's opening for the Technology/IT Internship Programme in London.

While I have a deep background in programming, developing various projects for my degree and in my own time as a freelancer, it is the opportunity for me to work with a company like Credit Suisse, one of the biggest investment banks in London, that intrigues me. I have a passion for programming that started when I was in high school, being 15 years old when I first wrote a piece of code in C++, and I take pride in the clean programs I develop now, 6 years later.

In my career I have done freelance web development, full stack applications during internships, simple game GUIs, and back ends for projects such as text-based RPGs, photo galleries, habitat simulators, and now I am working on machine learning clustering algorithms. My academic performance speaks for itself with an 84 overall in my introduction to Artificial Intelligence module and a 75 in my major software engineering year project, helping an NHS foundation reach out to less fortunate families.

What I can bring to Credit Suisse are a strong knowledge of imperative programming languages and an energetic will to work on game-changing projects. I am experienced working in a larger team, in pair programming, and even working independently, either from scratch or given base code to work on top of.

I invite you to examine my resume, and I look forward to hearing from you.

Sincerely,
Miruna Pirvulescu
